

The employment-law engine you *embed* — not another HR app.

A citation-backed, effective-dated rules engine for U.S. leave and wage & hour. Call it as a REST API or an MCP tool; every answer carries its statute.

THE QUESTION YOUR PRODUCT CAN'T ANSWER

Your customers ask your software one deceptively simple thing: *is this compliant?* Leave and wage law is fifty-plus jurisdictions of moving targets — minimum wages that reindex every year, brand-new paid-leave programs, overtime and exemption rules that change by city. Today you either staff a rules team, hard-code answers that quietly go stale, or let an LLM guess. All three are liabilities.

WHAT YOU EMBED

- § Every conclusion cites its statute — a justification tree, not a black box your customers can't defend.
- § Discretion is flagged, never faked — open-textured questions come back for a human; coverage gaps are reported, never hidden.
- § Effective-dated — "the law as of any date," so back-pay and audits reconstruct exactly what applied, and when.
- § Two call styles — REST for your backend, MCP for your AI features.

ALREADY REAL — A WORKING PROTOTYPE, OPEN TO AUDIT

16 leave regimes every U.S. paid- family -leave program	Wage & hour min wage + 12 localities, overtime, exemptions, final pay	MCP 4 read-only tools – the verified oracle behind your copilot	Open source encodings – audit every line against the statute	224 automated tests gate every change
---	--	--	---	--

Why embed, *not build*.

You don't want to be in the employment-law-maintenance business. Encoding the law once is easy; keeping it current across every jurisdiction, forever, is a team you'd rather not run. That maintenance — an LLM-drafted, regression-gated, **counsel-reviewed** amendment pipeline — is what you're actually buying.

THE DESIGN-PARTNER OFFER

WHAT YOU GET

- Early, partner-priced access to the API and MCP tools
- A direct line into the roadmap — you pick which jurisdictions and rules we verify and ship first
- The open-source encodings to audit against primary sources yourself
- White-glove integration support

WHAT WE ASK

- Real use cases, and candid feedback on where the edges are
- A design-partner reference — once we've earned it

Straight talk: *statutory figures are web-researched and being verified by counsel now — design partners shape that queue. We'd rather show you the edges than oversell past them.*

Let's scope an *integration*.
